

Form Builder Addon

The **Form Builder Addon** is a powerful tool that allows only **admins** to create and manage custom forms within the application. Designed for flexibility and control, this addon enables the admin to build various types of forms tailored to specific use cases—without writing any code.

Admin Guide:

To install an addon, the admin can go to the admin panel, click on 'Addons' in the left navigation, and choose the option to install an addon. By clicking on 'Add New Addon,' uploading the purchase code and addon zip file, and then clicking 'Install Addon,' the addon will be successfully installed.

Admin panel settings, then to system settings — from there, the admin can enable or disable the form builder. If the admin enables the form builder, then users will be able to see it on the frontend.

From the settings, when the admin clicks on the Form Builder, they will be able to see the 'View' tab within the Form Builder section.

The screenshot shows the Atlas Form Builder interface. On the left, a sidebar contains navigation links: My Shops, Agent Packages, Blogs, Newsletter, Addons, Settings (highlighted), and My Profile. Under Settings, there are sub-links: System Settings, Website Settings, Payment Settings, Form Builder (highlighted with a red box), Language Settings, SMTP Settings, SEO Settings, and About. The main content area is titled 'Form Builder' and has tabs for Hotel, Car, Beauty, Restaurant, and Real-estate. The form itself has four sections: 'Date And Time' with a date input field, 'Name' with a text input field, 'Email' with a text input field, and 'Message details' with a text area. At the bottom, there are two buttons: 'Save Field Order' and 'Edit'. A '+ Add New Field' button is located in the top right corner.

On the right side, when the admin clicks the 'Add New Field' button, they'll get the option to create a form using the builder. While creating a field, they must select a type — this type indicates the category under which they want to add a custom field.

From the right side, they can drag and drop the custom field, customize it as needed, and click the 'Create' button. Once done, the form will be created for the selected type.

The screenshot shows the Atlas Create Form interface. The left sidebar is identical to the previous screenshot. The main content area is titled 'Create Form' and has a '← Back' button in the top right. It features a 'Select Type' dropdown menu with options: Select Type, Hotel, Beauty, Car, Restaurant, and Real-Estate. To the right of the dropdown is a list of field types: Text Field, Text Area, Date Field, Select, Number, Radio Group, and Checkbox Group, all enclosed in a red box. A red arrow points to the 'Create' button at the bottom left.

When you create a form, it will be saved under the type you selected, and you'll be able to see it in that specific tab.

The screenshot shows a form builder interface. At the top, there is a horizontal tab bar with five tabs: "Hotel", "Car", "Beauty", "Restaurant", and "Real-estate". The "Hotel" tab is selected and highlighted with a red border. Below the tabs, there is a list of custom fields. Each field has a title and a text input area. The fields are: "Date And Time" with a placeholder "mm/dd/yyyy" and a calendar icon; "Name" with a placeholder "enter name"; "Email" with a placeholder "enter email"; and "Message details" with a placeholder "write your queries" and a text area icon. Below the fields, there is a grey bar with the text: "You can reorder the fields by dragging and dropping each item. The order you set here will be reflected on the frontend." At the bottom, there are two blue buttons: "Save Field Order" and "Edit".

You can reorder the fields by dragging and dropping each item. The order you set here will be reflected on the frontend.

Save Field Order Edit

From here, you can drag and drop the custom fields to sort them — meaning the admin can change the position of the custom fields as they wish. The positions set here will be reflected on the frontend under that specific type, and the custom fields will appear in the same order.

When the admin clicks the Edit button, they will be able to edit, update, and

add fields for that type. If needed, they can also delete fields from there.

The screenshot displays the 'Update Real-Estate Form' interface. At the top left, there is a header 'Update Real-Estate Form' with a settings icon. At the top right, there is a 'Back' button. The main area contains a form with four fields: 'Date And Time' (with a placeholder 'mm/dd/yyyy'), 'Name' (with a placeholder 'enter name'), 'Email' (with a placeholder 'enter email'), and 'Message' (with a placeholder 'write something'). Above the 'Date And Time' field, there is a toolbar with icons for delete, edit, duplicate, and move up/down. A red arrow points to the edit icon. Below the form, there is a blue 'Update' button with a red arrow pointing to it. On the right side, there is a sidebar with a list of field types: Text Field, Text Area, Date Field, Select, Number, Radio Group, and Checkbox Group.

The custom fields created by the admin for a specific type will be visible on the details page of that type on the frontend. From there, users will be able to book an appointment.
